

Two kinds of AI — and where the precision isn't

Capital floods low-precision AI. Even physics AI — PhysicsX, Prometheus — runs on low-precision neural surrogates.

Semiqulassical • Attryx computes the physics at high precision — near 128-bit. The whole right side is open.

Bubble area = investment, log-scaled (illustrative). Basis varies: AI data-center = capex to 2030; physics-AI/quantum/drug = 2025 funding; HPC = market size. Sources in spec. Axis positions are approximate category placements; the pattern — capital concentrated at low precision, the high-precision physics corner open — is the point.
